Yuxuan Fang

+1(734)904-7490 | yuxuanf@umich.edu

Education

University of Michigan - Ann Arbor *Ann Arbor, USA*

MSE in Electrical Engineering *Sept 2022 - Present*

- Major in Control Systems Track
- **Courses:** EECS 460: Control Systems Analysis and Design, EECS 560: Linear Systems Theory, EECS 566: Discrete Event Systems (FA 2022); EECS 562: Nonlinear Systems and Control, EECS 565: Linear Feedback Control Systems (WN 2023); AEROSP 590: Directed Study (Advisor: Prof. Max Z. Li, SP-SM 2023).
- Current GPA 4.0/4.0.

Huazhong University of Science and Technology *Wuhan, China*

B.Eng. in Electrical Engineering *Sept 2018 - Jun 2022*

- Major in Electrical Engineering and its Automation - Power Electronics and Electric Drive.
- Graduated with GPA 3.81/4.0.

Publications

Brief Talk about Application of Matrix Control in Industrial Automation *Published*

Techniques of Automation and Applications *Mar 2021*

- Designed a PLC-SCADA system design regarding bag precipitators cleaning with STEP-7 and WinCC.
- Reduced the complexity by cutting the number of the timer from $m \times n$ to 2. Thus increased the reusability and extensibility of the system.
- Please review `bit.ly/CNKI-FYX` for English abstract.

The Optimization of Control Logic Based on Abrasion-Averaging Model *Published*

Techniques of Automation and Applications *Nov 2021*

- Designed a pump station based on PLC-SCADA architecture with STEP-7 and WinCC.
- Managed the oprations of the pumps as equally intensively as possible according to the water level. Avoided idle or long-run damage.
- Please review `bit.ly/CNKI_2-FYX` for English abstract.

School Projects

Proton Therapy Simulator *Undergraduate Student Project*

Huazhong University of Science and Technology *Jun 2020 - Jun 2021*

- Designed an algorithm for proton therapy simulation using Geiger's Formula. Solved the problem of infinity energy peak in the formula.
- Integrated the simulation algorithm together with some semi-respiratory gate controls into a Raspberry Pie as a simulator.

Communication of a Magnetic Bearing Control System and its Upper System Design *Bachelor's Thesis*

Huazhong University of Science and Technology *Dec 2021 - May 2022*

- Upon a DSP-based magnetic bearing system, designed a customized communication protocol including package data paradigm, necessary data processing operations, details to utilize UDP protocols, etc.
- Composed a GUI and its APIs with Python, which smoothly controls the system and visualizes the communications information.

Plausible Deniability and Privacy Analysis in the Drone Package Delivery Systems *Master's Directed Study*

University of Michigan - Ann Arbor *May 2023 - Present*

- Anticipated to form possible reachable set of drones in certain urban environment, then quantify the plausible deniability.

Work Experience

Nanjing Electrical Engineering & Technology Co., Ltd HTC *Nanjing, China*

Intern at Department of Engineering *Jul 2020 - Aug 2020*

- Designed a PLC-SCADA system for the pump station with STEP-7 and WinCC, which organizes the system well.
- Pubished a paper based on the design in Nov. 2021.

Skills

Programming Python, MATLAB, C/C++, SQL

Daily Use Mathematica, Mark Down, LaTeX, Microsoft Office.
